

MUMIP Meeting

February 2024

Cycle48 OIFS SCM

- New release with radiation fixes
- Installation on JASMIN. Inconveniences (envs issues → loads of mails/time)
- TESTING

Currently, it's not sufficiently reliable to work with!
(as of Monday)

Cycle48 OIFS SCM

- New release with radiation fixes
- Installation on JASMIN. Inconveniences (envs issues → loads of mails/time)
- TESTING

Currently, it's not sufficiently reliable to work with!

FIXED

SCMtiles

- Initial conditions script from DKRZ files 2D (z,t) → 4D (x,y,z,t)
 - Missing variables: TKE, albedo (emissivity, z0q/h)
 - Interpolation & padding
 - Current estimate of file size: 6-8 GB per day just for inits
- Installation locally in Oxford
 - JASMIN installation planned, as SCM doesn't run properly not yet useful

FIXED

Budgets IFS

- Note: budgets show that spin-up in e.g. BL for test case (ARMCU) is slightly affected by dt
- Test in 3 settings:
 - forcing by SST
 - forcing by fluxes
 - forcing by both flags True

$$T = D + P$$

$$\int T dt = \int (D + P) dt$$

$$\phi(t) = \varphi_0 + \int T dt = \varphi_0 + \int (D + P) dt (+Res.)$$

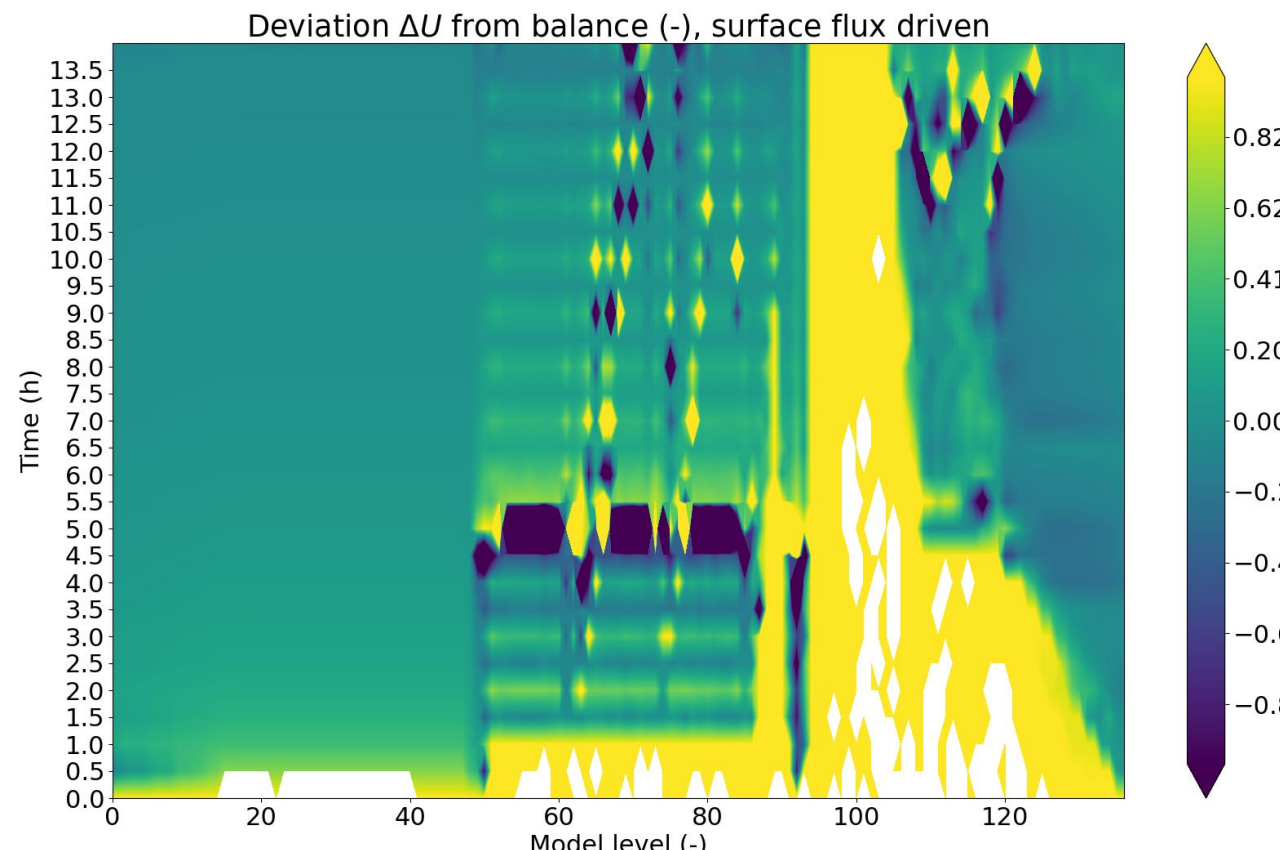

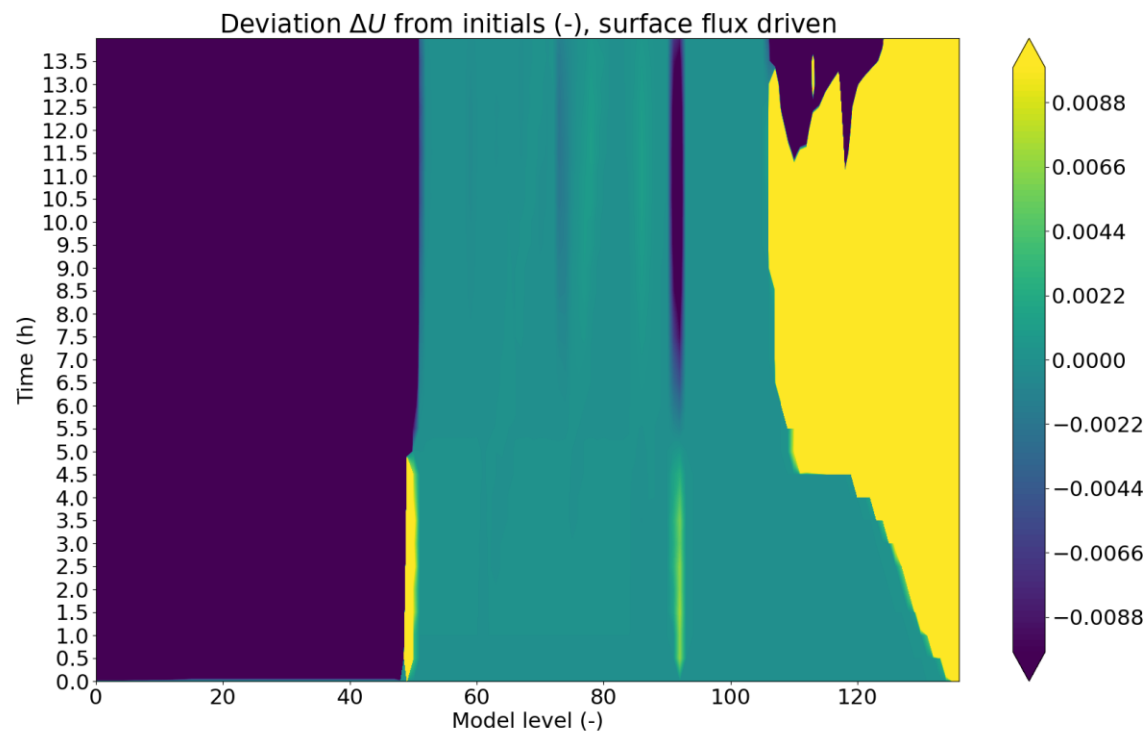

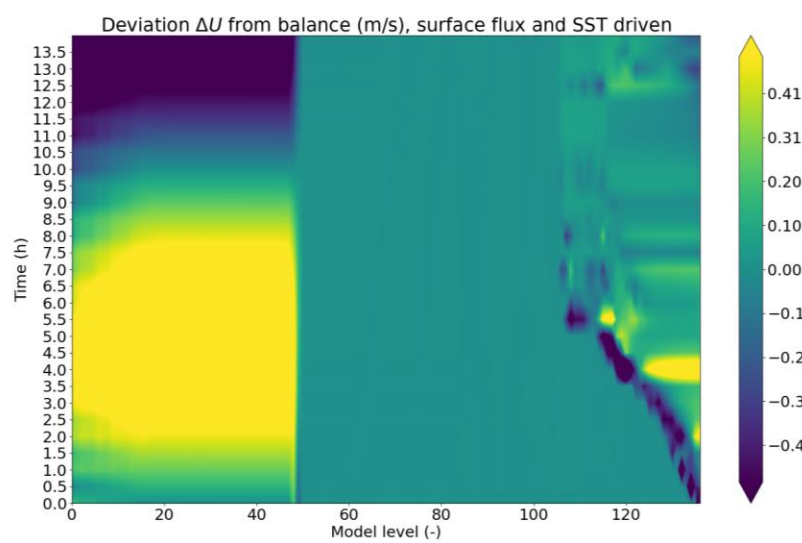

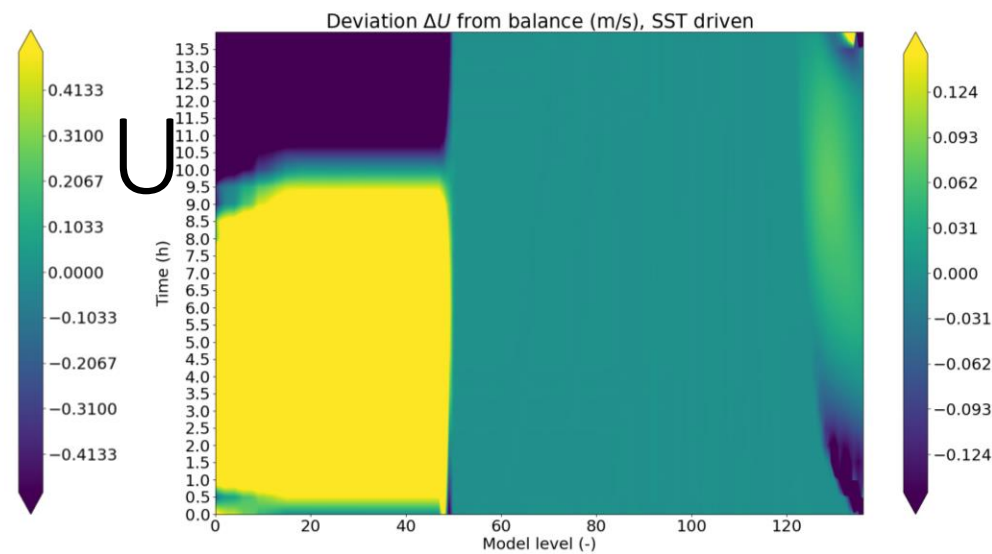

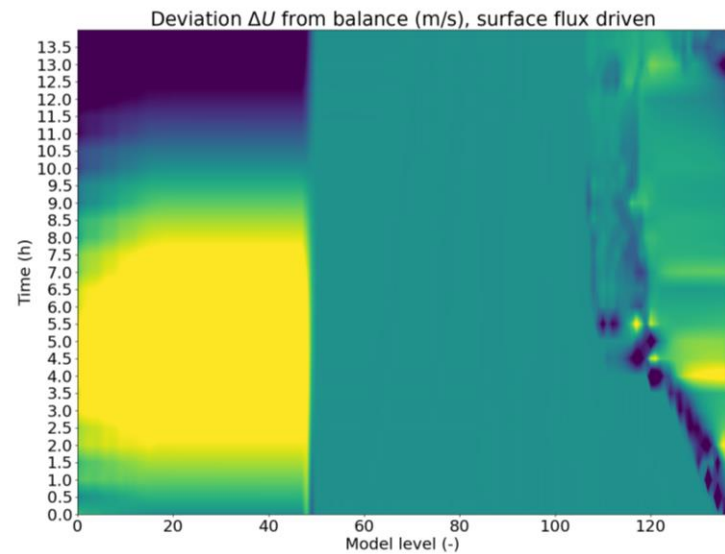

Task: reconstruct initials back from state and acc. tendencies

$$T = D + P$$

$$\int T dt = \int (D + P)dt$$

$$\phi(t) = \varphi_0 + \int T dt = \varphi_0 + \int (D + P)dt (+Res.)$$

Task: reconstruct initials back from state and acc. tendencies

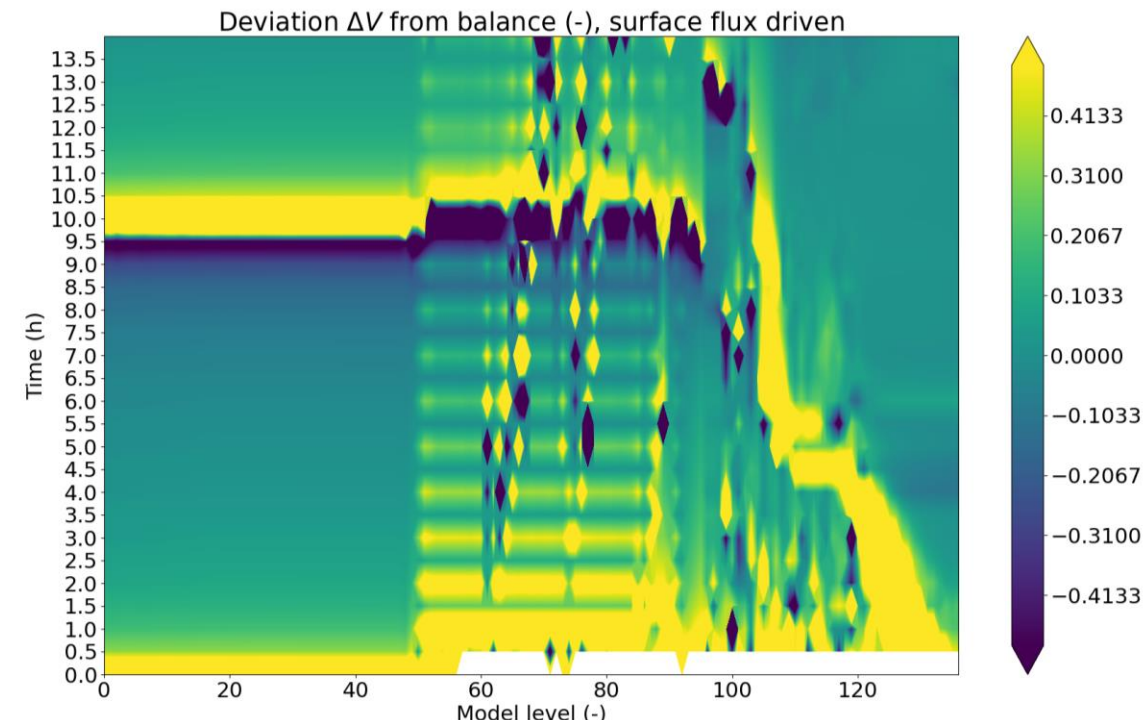

Deviation ΔV from balance (m/s), surface flux driven

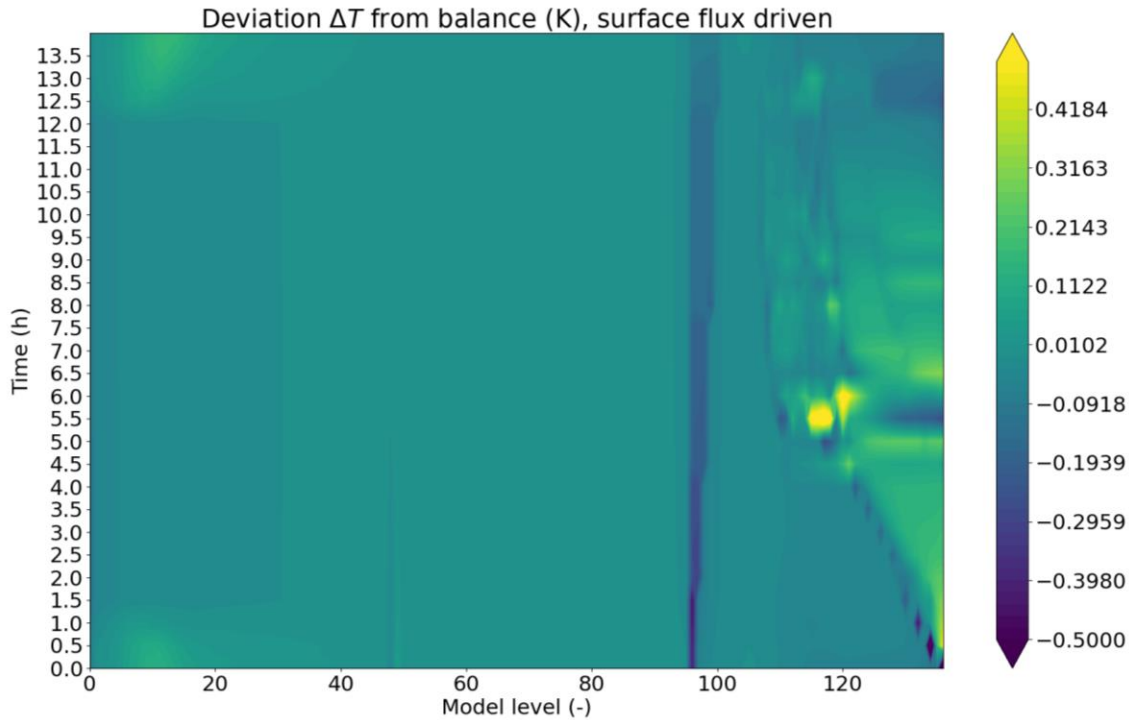

Deviation ΔV from balance (m/s), SST driven

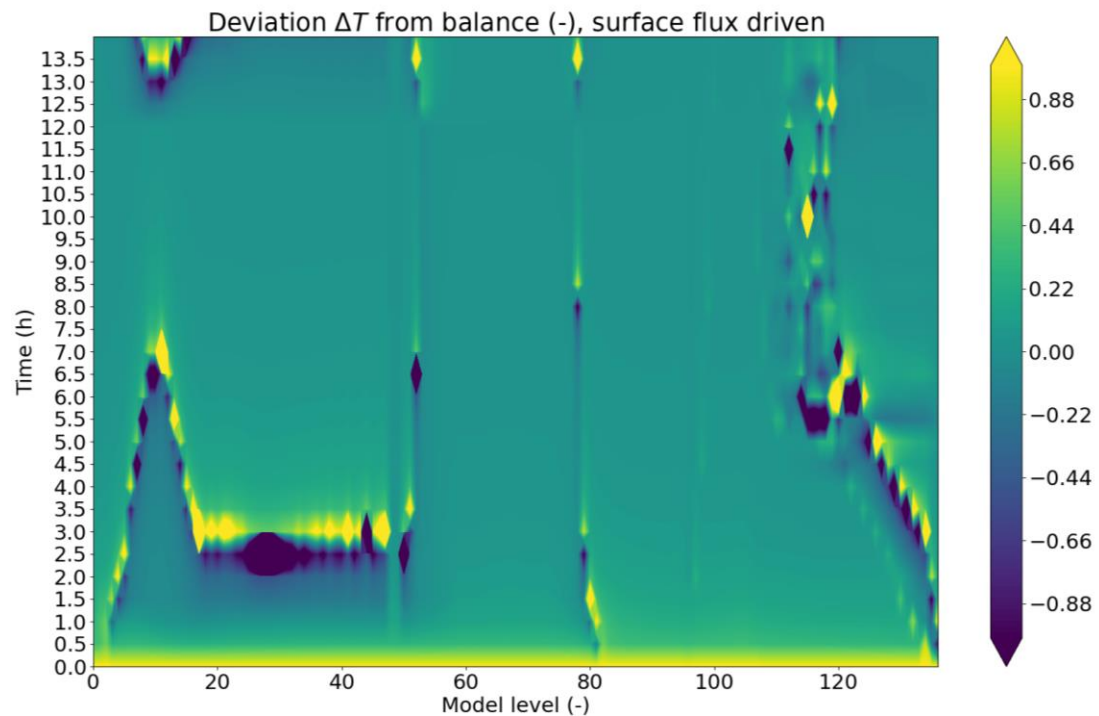

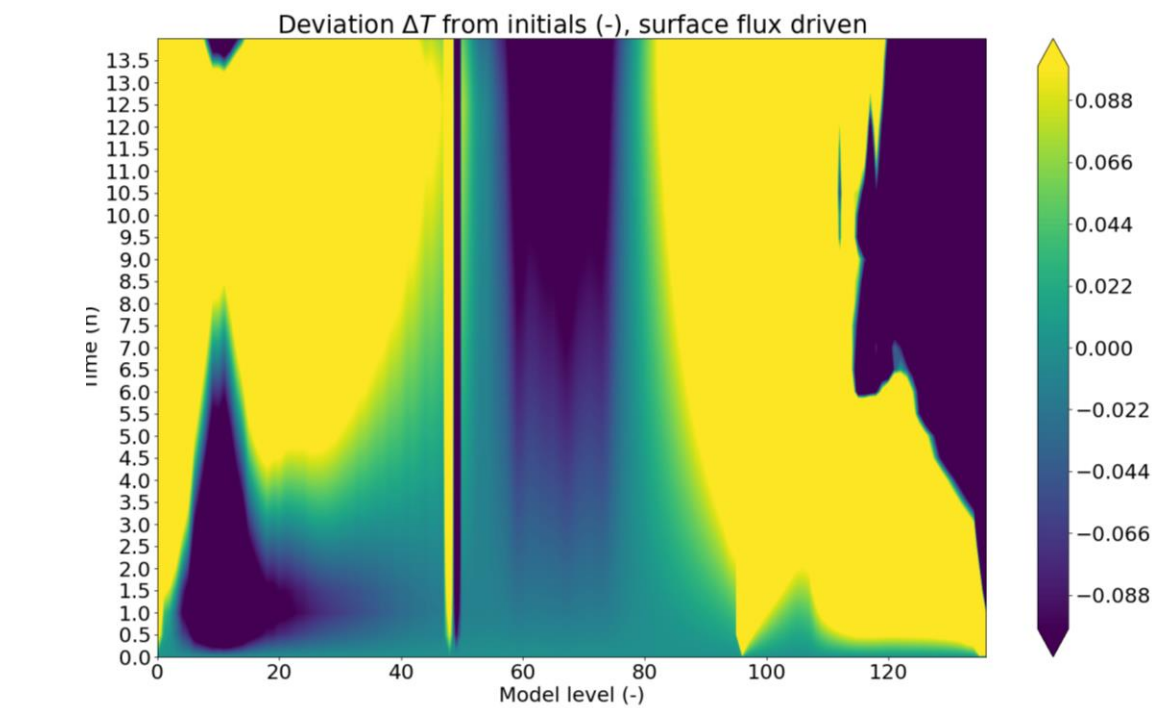

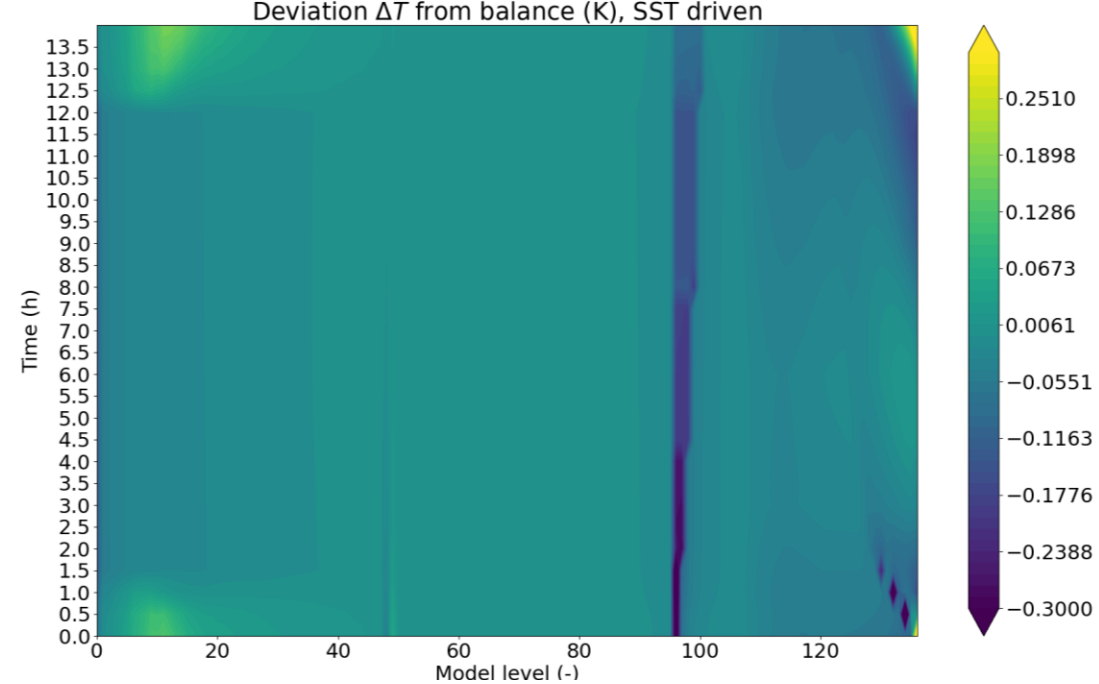

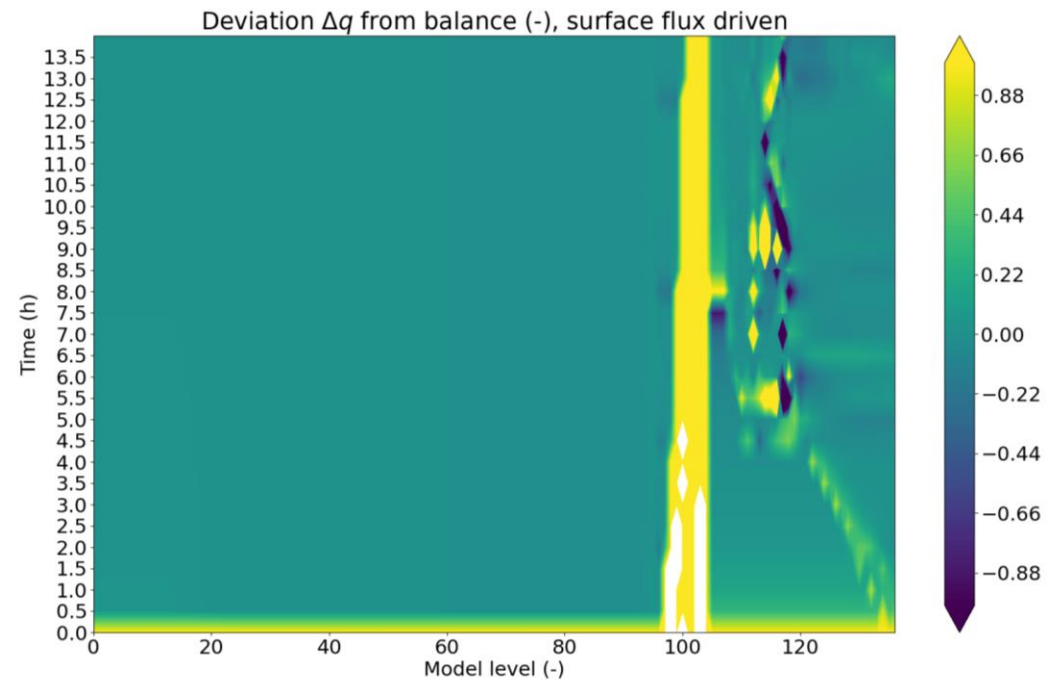

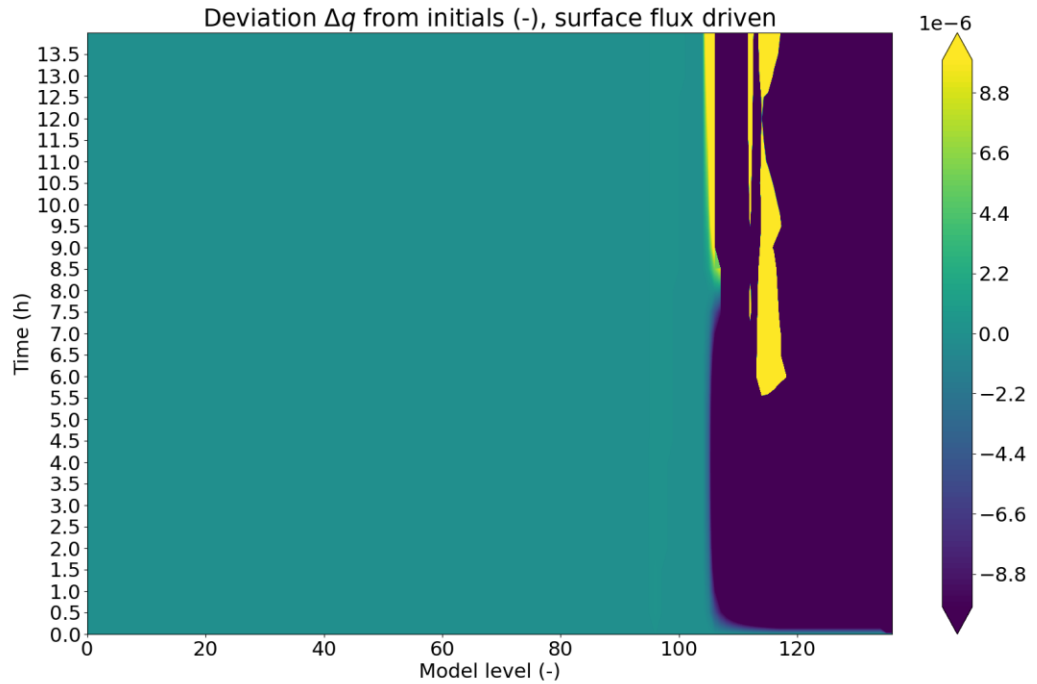

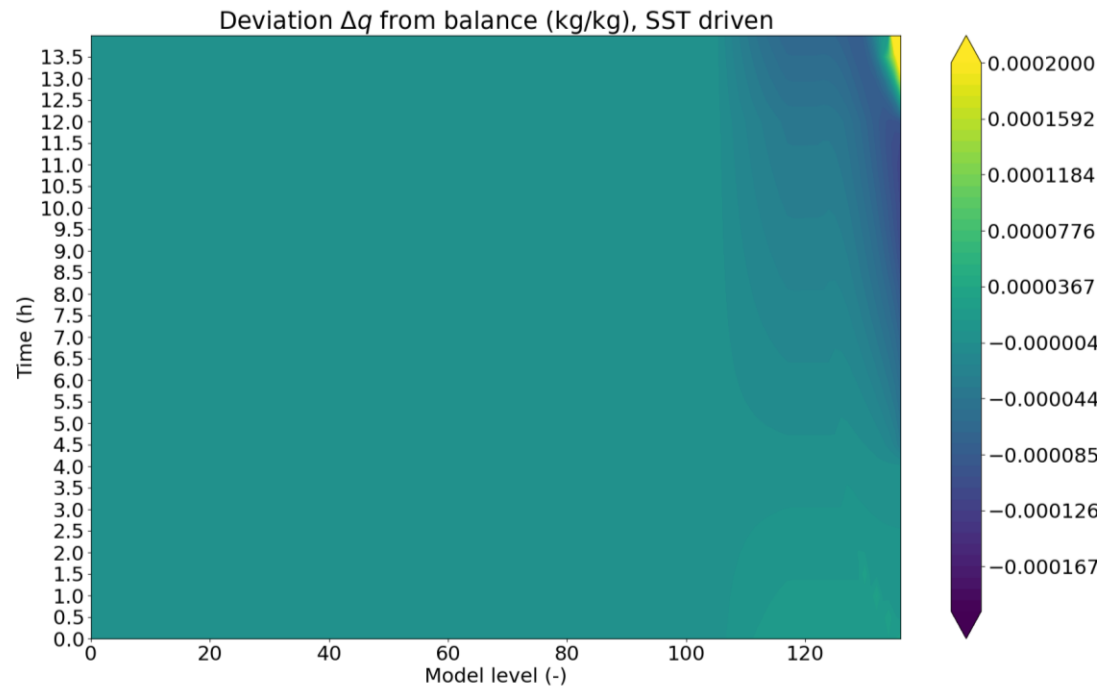

V

T

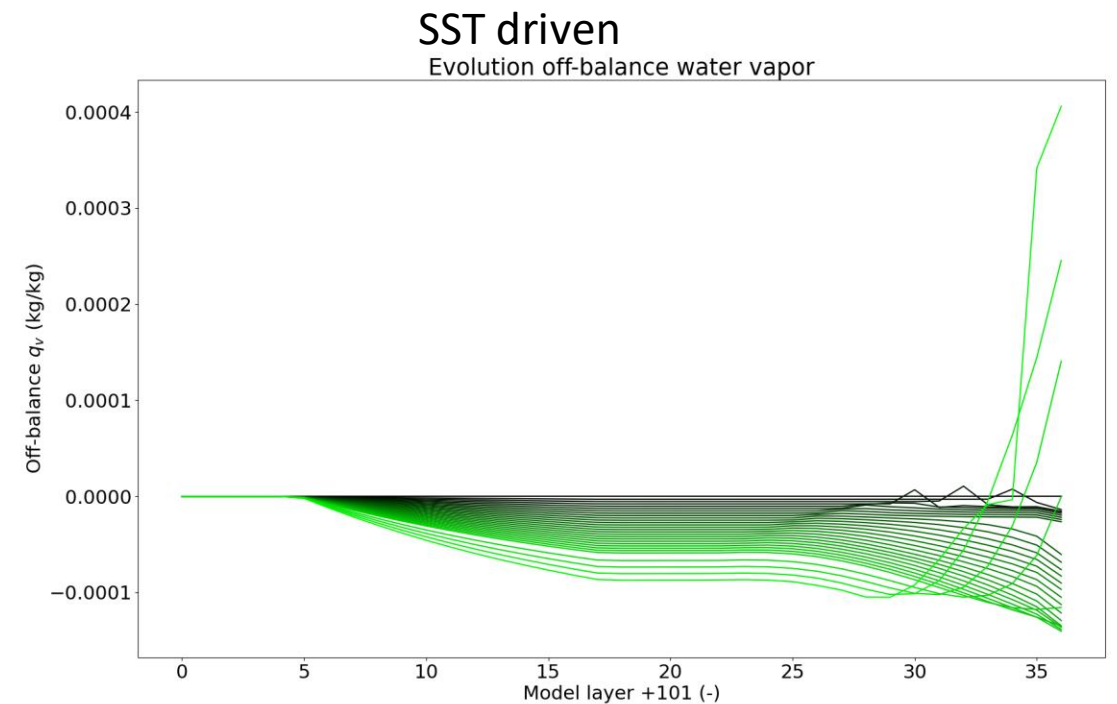

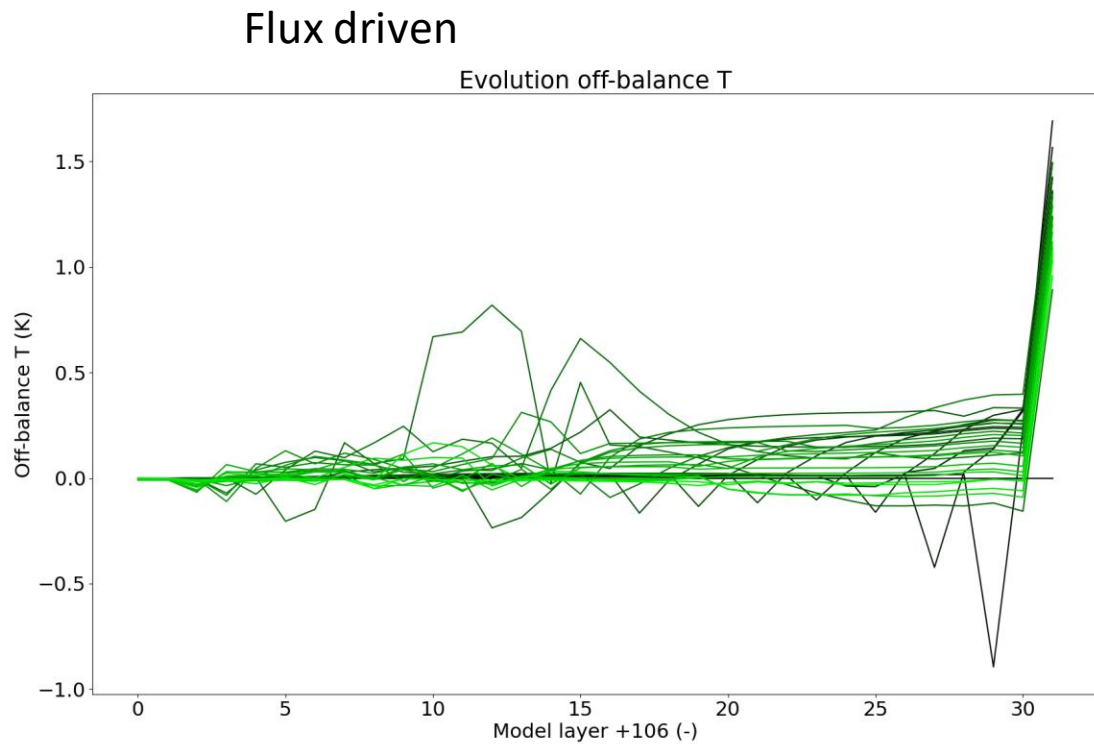

Q

Budget deviations

Flags such as semi-lagrangian averaging affect tendencies

- For a number of flags, the model breaks if I try to investigate their role in budget closure

Summary

- Budget closes relatively well

But: energy constraints + numerical diffusion?

- Ekman spiralling?
- Aliasing onto different layers (in particular BL-top; free troposphere, affected by e.g. S-L-Avg)
- Padding regions have residuals
- Closure of near-zero regions can't be tracked very well
